

# Living on Master:

Using Yocto Project, Jenkins and LAVA for a rolling release

Tim Orling  
Intel Open Source Technology Center

You're doing it all wrong.

Here's why.

# Traditional Approach: “Fork It and Forget It”

- Pin upstream at a fixed version
- Make changes in tree
- No patches sent upstream

# Traditional Approach: “Fork It and Forget It”

- Obsolete from day one
- Upstream never stops
- Huge technical debt

# Follow the Linux\* kernel release model

- <http://www.kroah.com/log/blog/2018/02/05/linux-kernel-release-model/>
- Upstream First
- Backport to stable branches
- Constantly moving code-base

# Everyone has their own solution

Time to share.

# Motivations

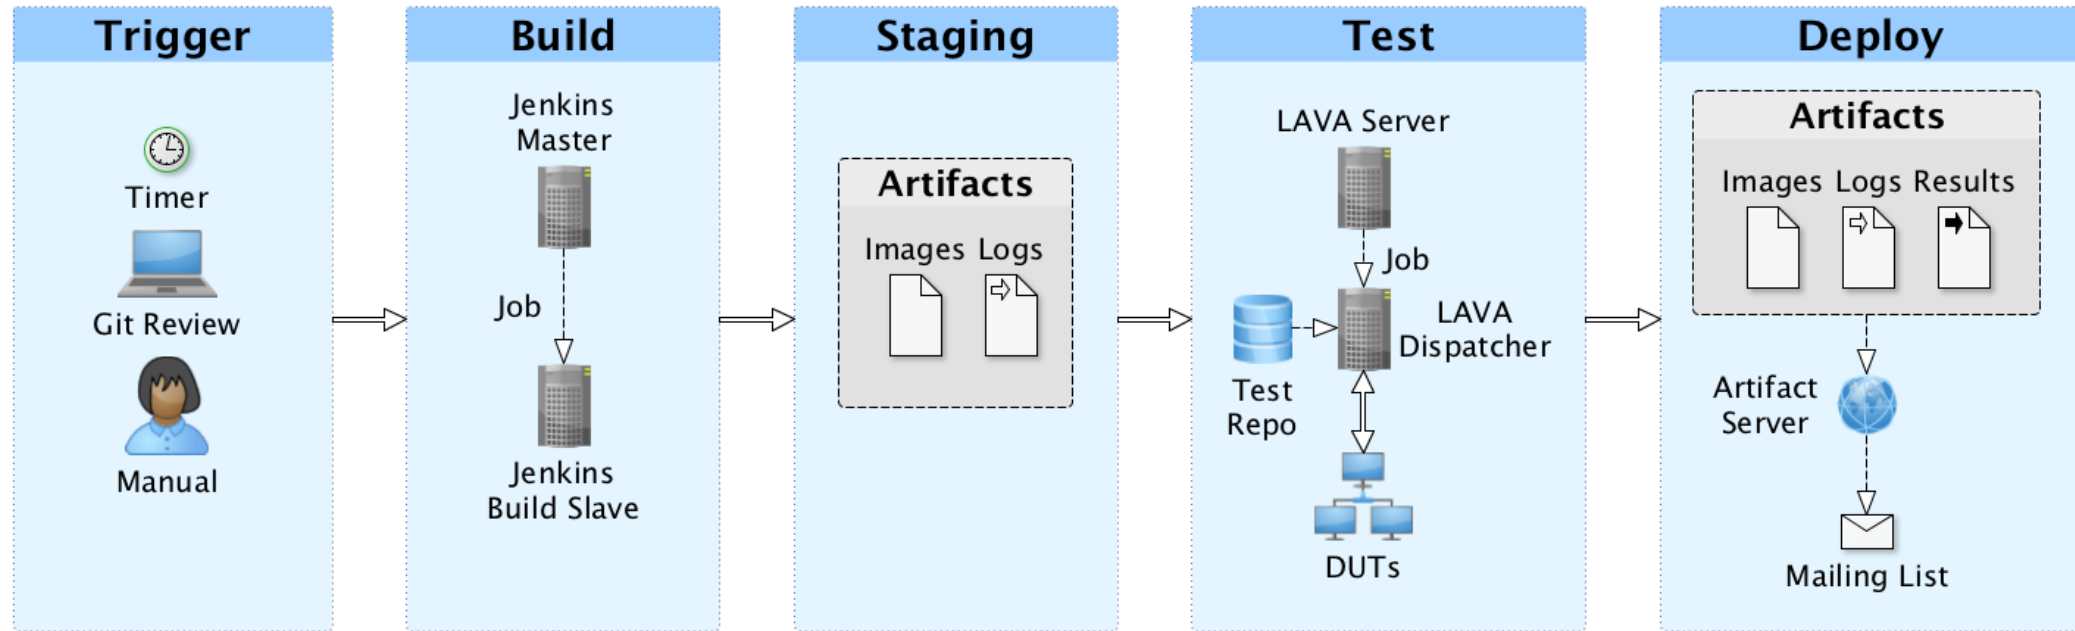

# Inspirations

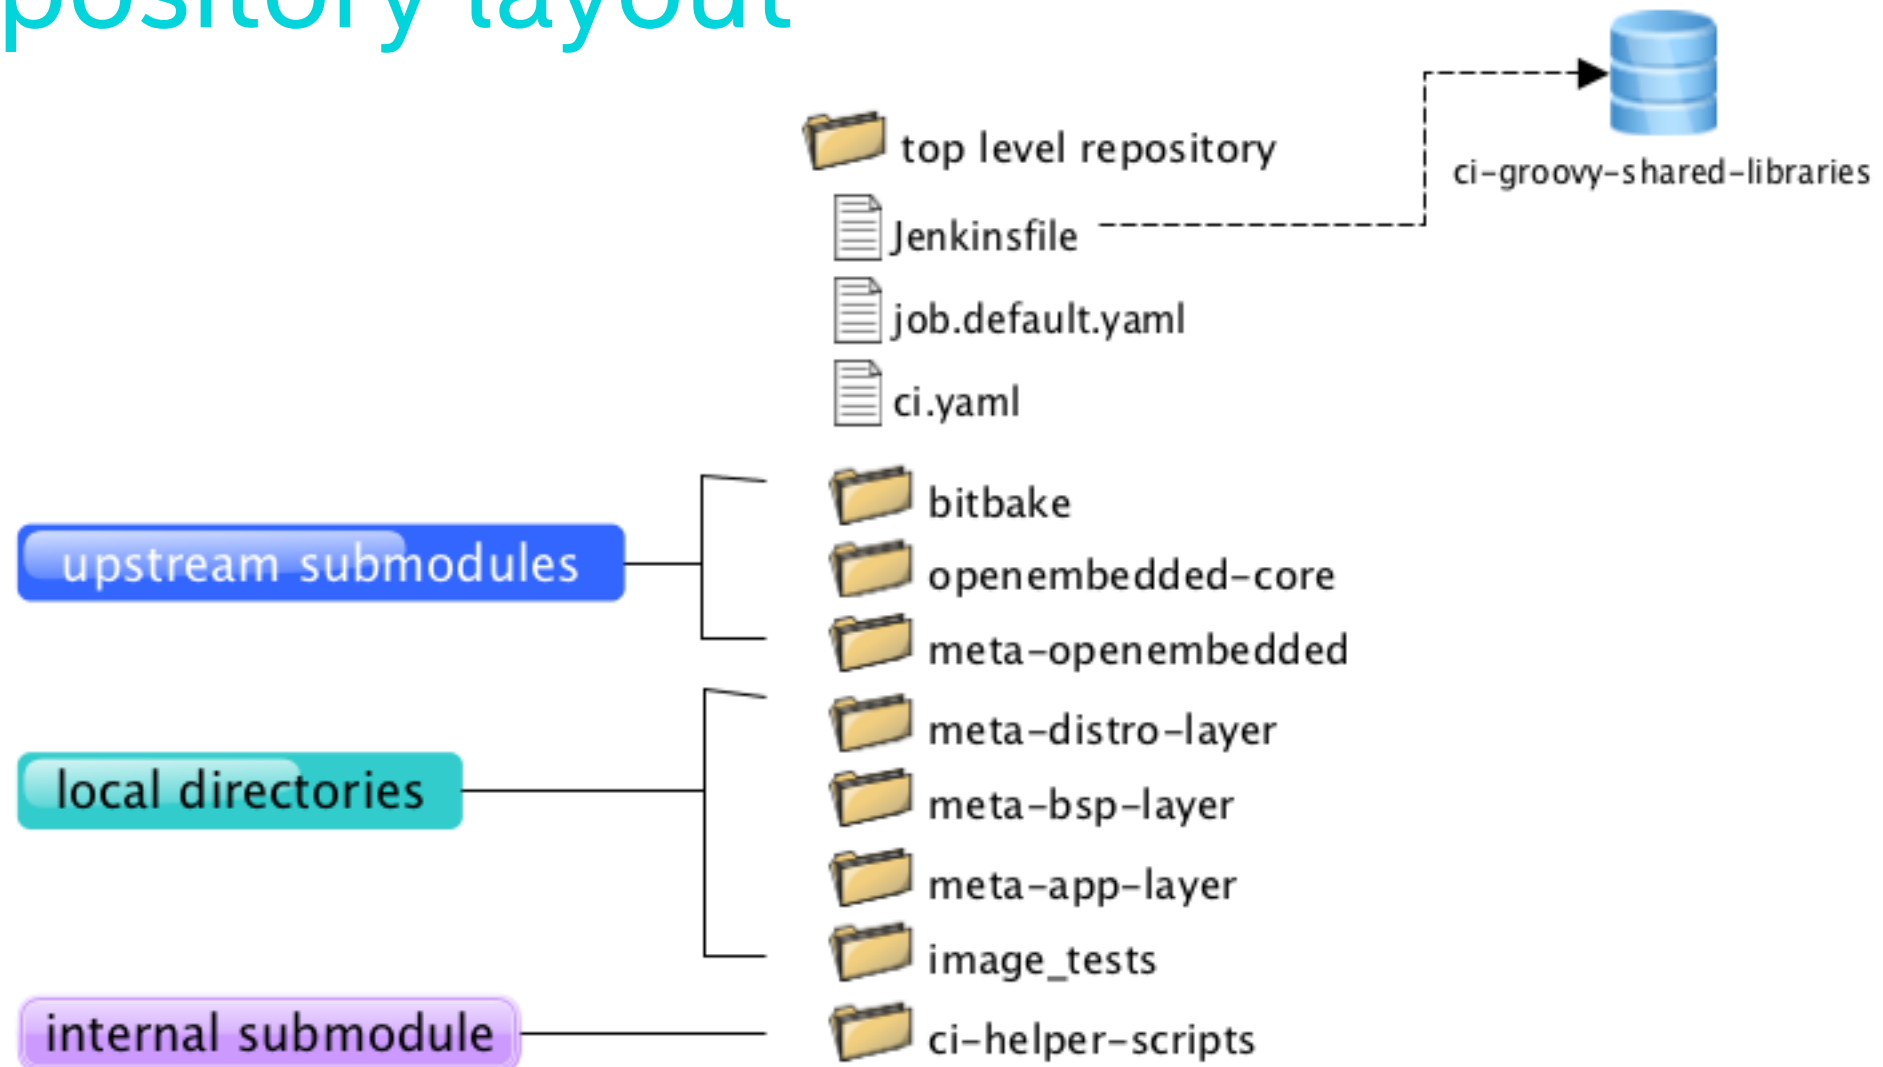

# System overview

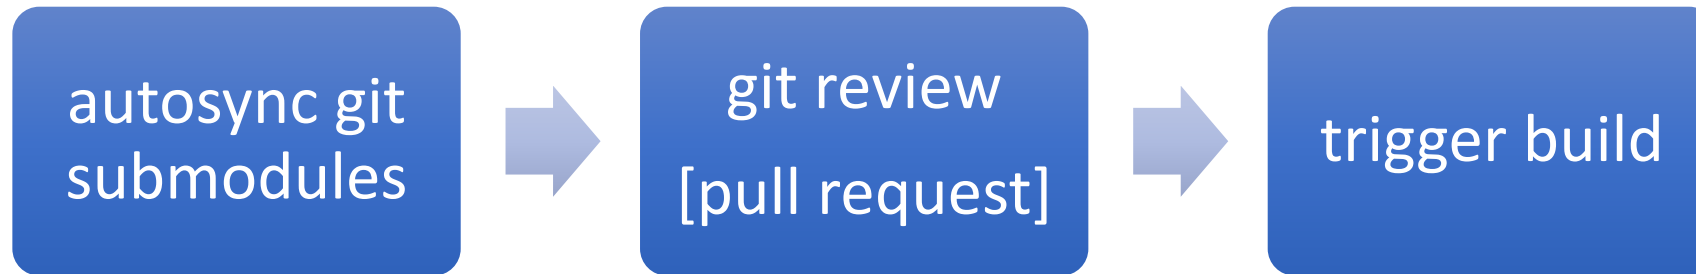

# Repository layout

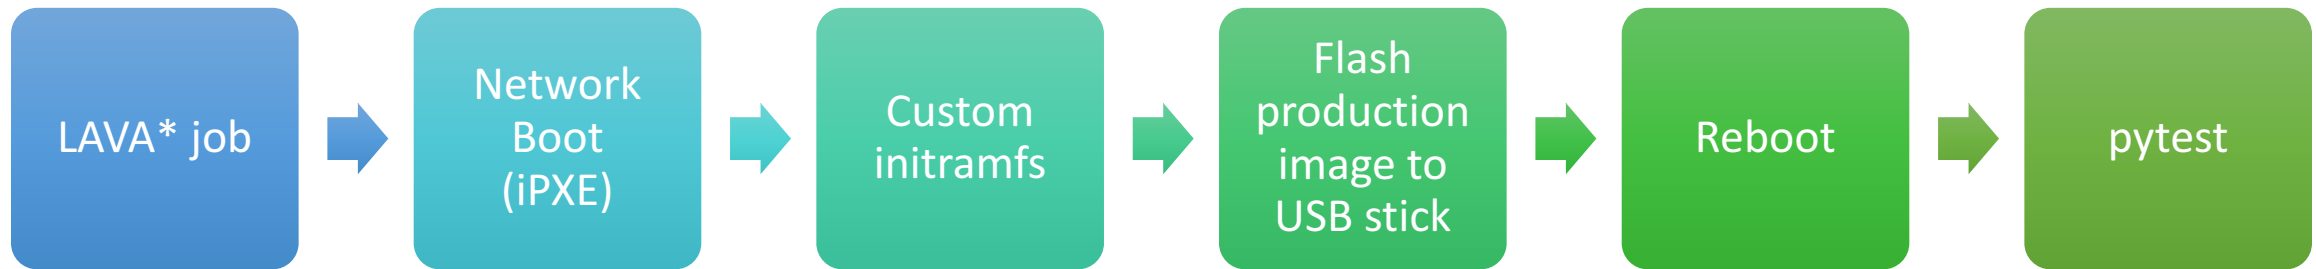

# Use automation to stay up to date

- Continuous Integration job runs daily

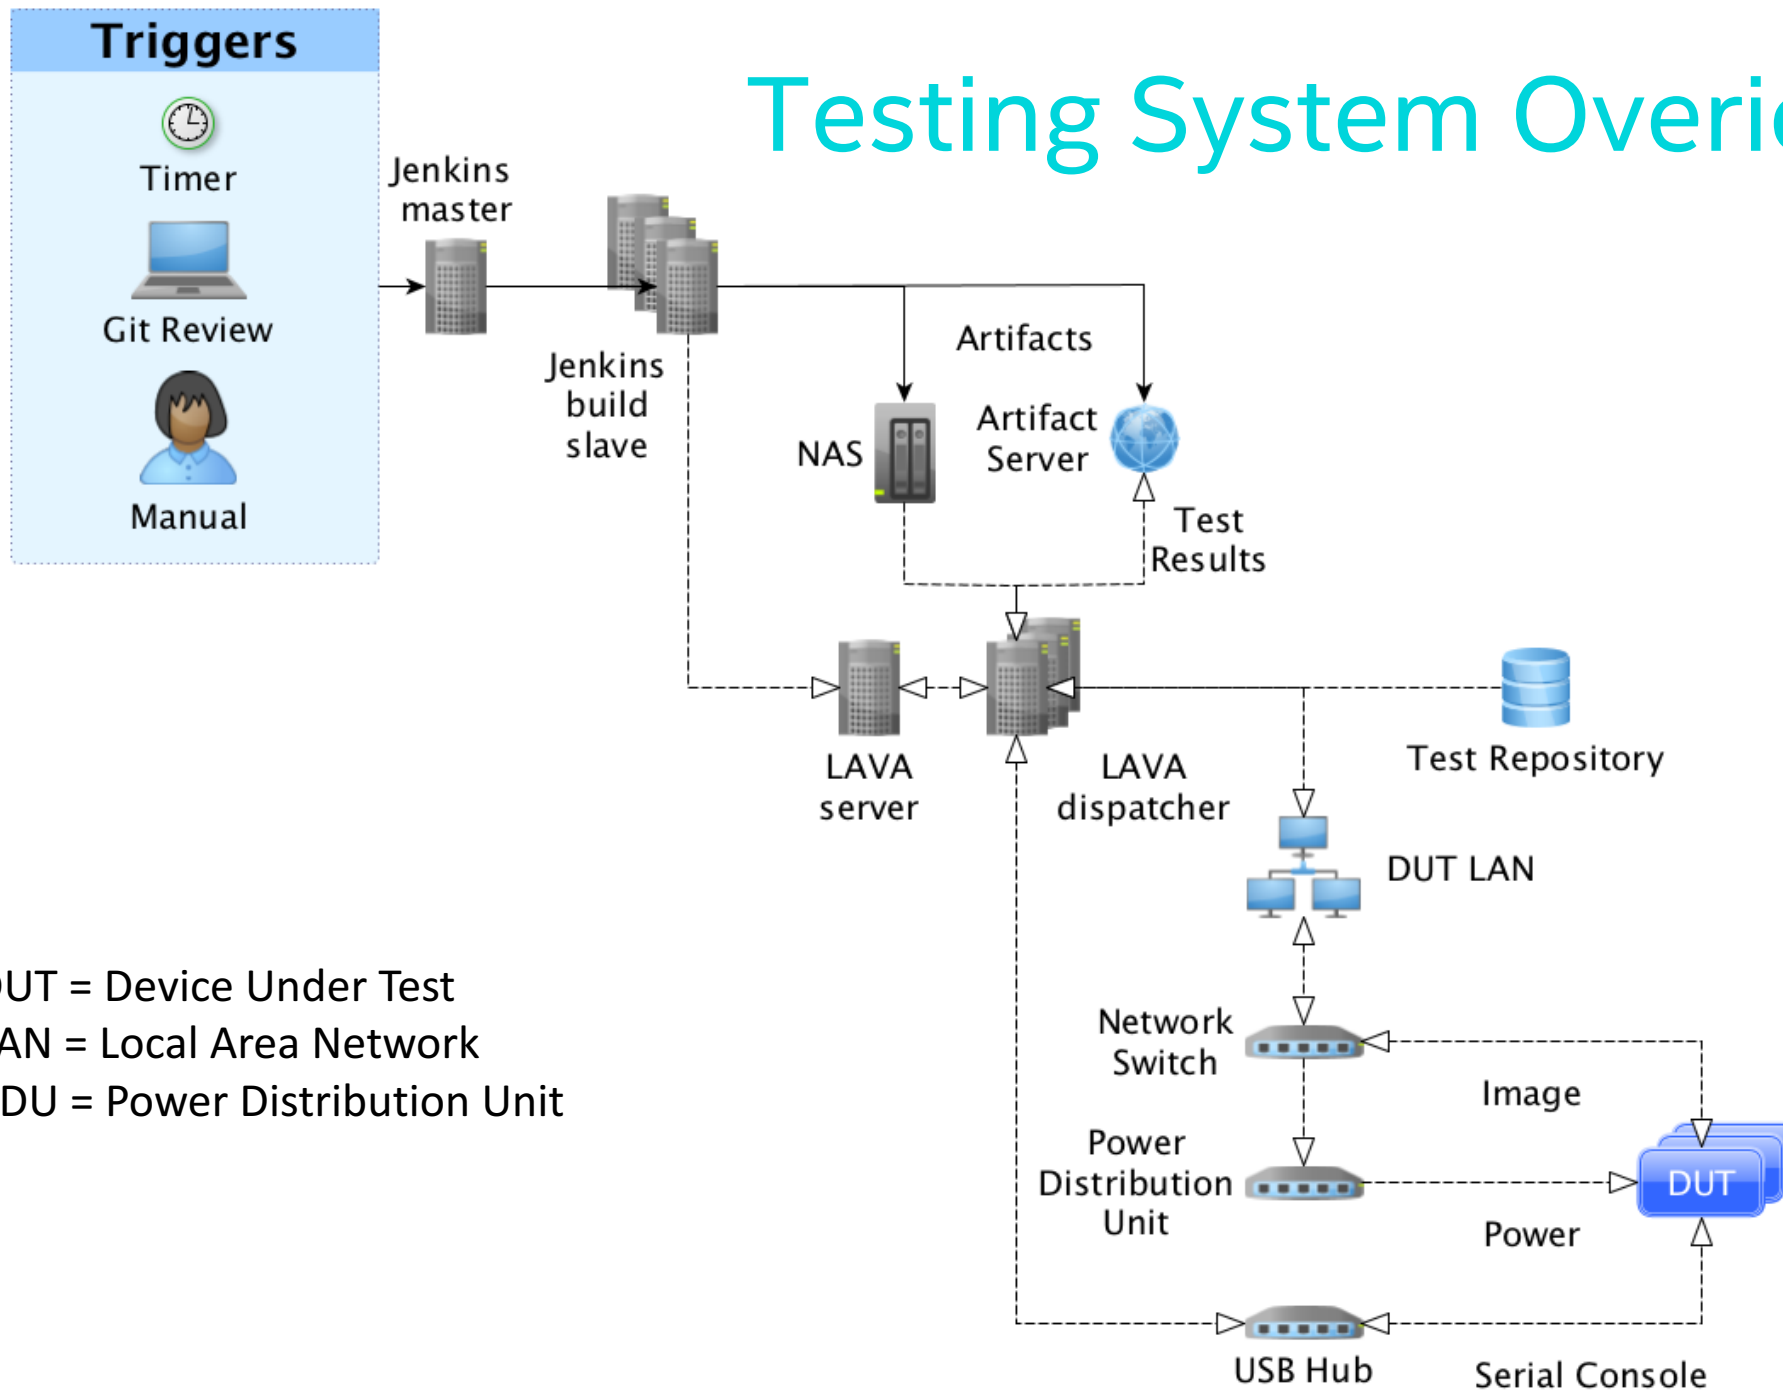

# Testing production images

- Tests run on every build

pytest is an Open Source testing framework

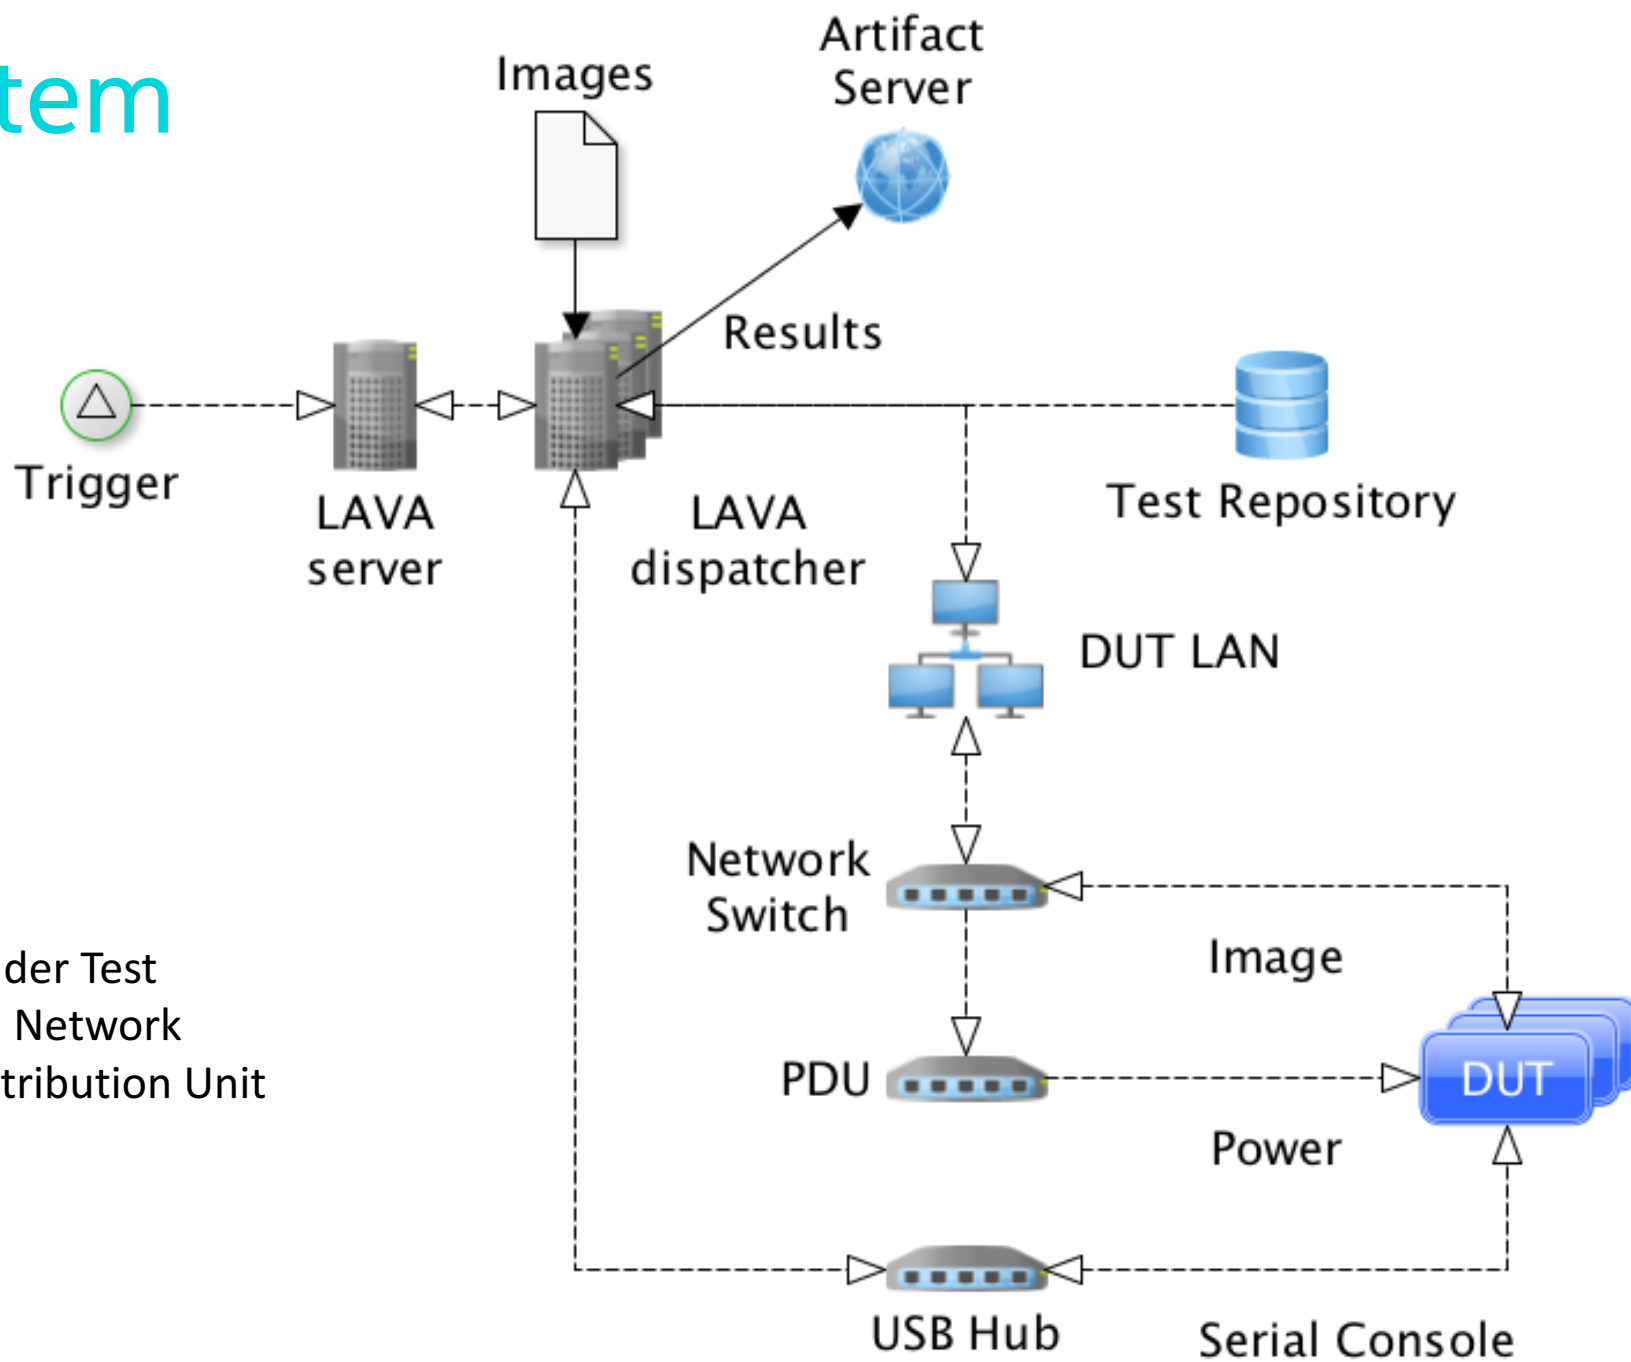

# Testing System Overview

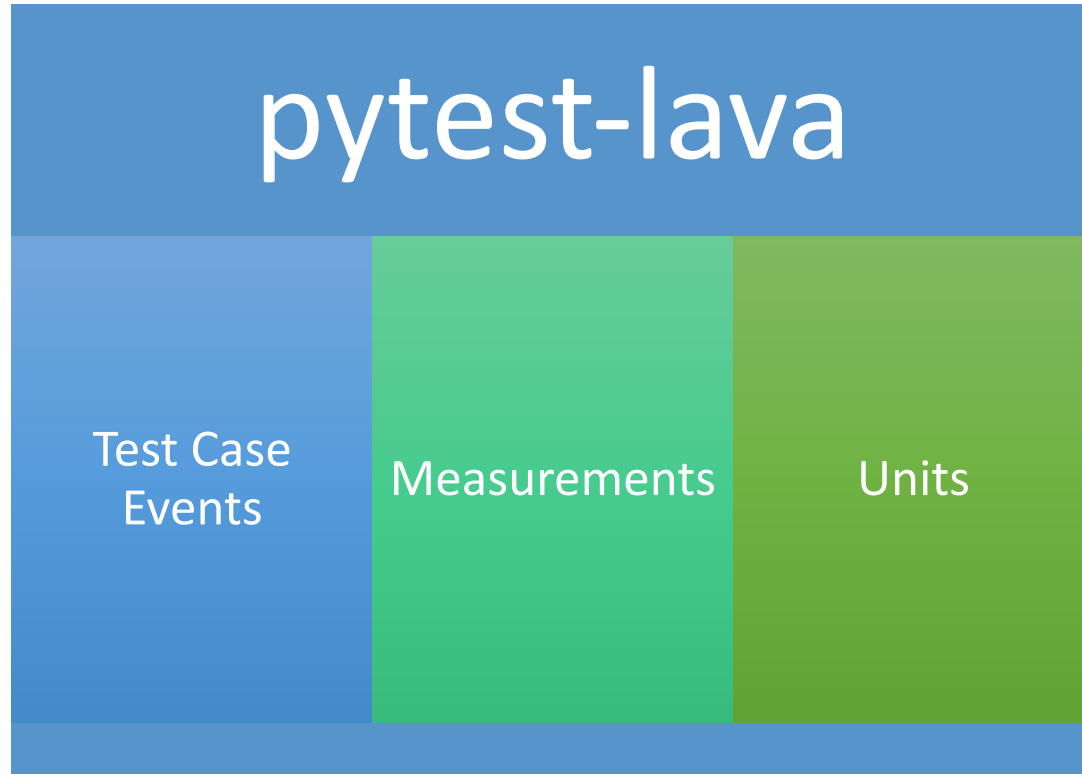

# Testing System

DUT = Device Under Test  
LAN = Local Area Network  
PDU = Power Distribution Unit

# Next Steps

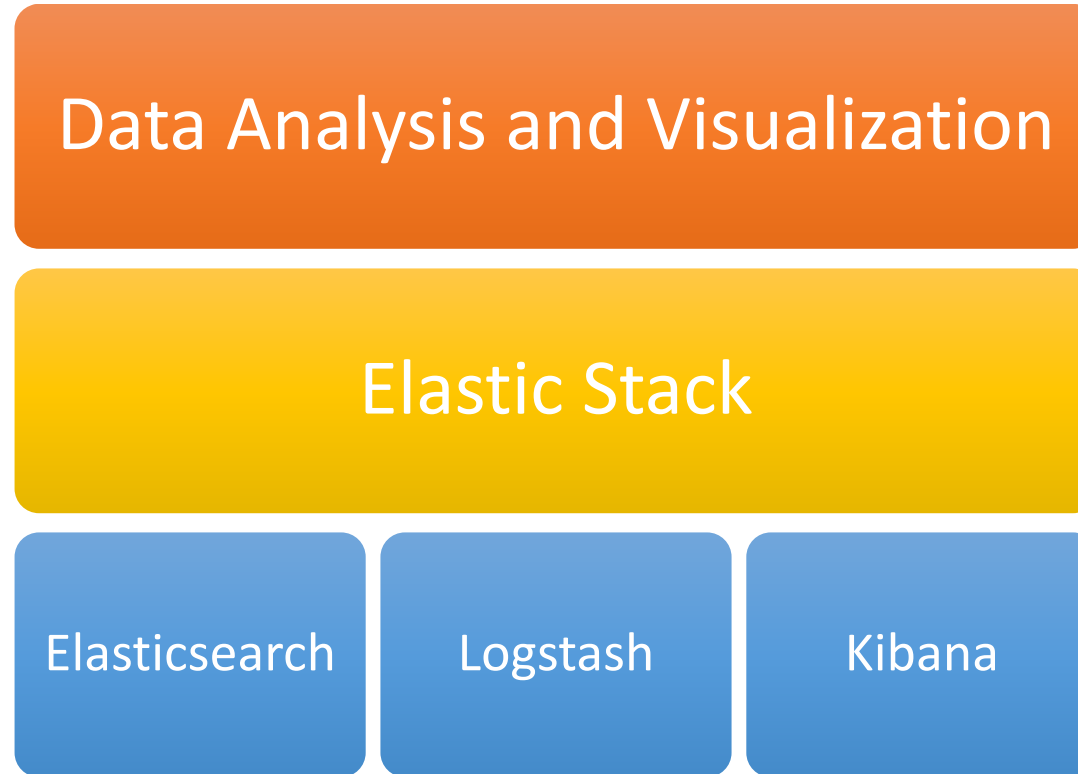

- Test Case events working well
- Measurements and Units under development
- Need to complete internal Open Sourcing process

# Next Steps

- Industry Standard Result Formats
  - Test Anything Protocol
  - JUnit.xml

# Next Steps

# Let's do this.

Moving forward.

# Reference Enterprise Class System

## End-to-End Complete

- Orchestrated containers?
  - “Easy” to deploy
  - “Effortless” to replicate
- Internal Layer Index
- Jenkins Master
- Artifact server
- Data Visualization

## Public LAVA server

- Share and Re-use test definitions
- Distributed LAVA dispatchers
  - Containerized
  - Better HW coverage
    - Each site focuses on platforms they care about

Questions?
